The forearm: radioulnar articulation

**FOREARM PRONATION**

- the bony thickening on the proximal aspect of the radial head pushes the radius distally; however, the radius "shortens" as it crosses over the ulna

---

---

---

---

---

---

---

---

4

The forearm: radioulnar articulation

**FOREARM PRONATION**

- at the distal radioulnar joint (DRUJ), the ulnar head will appear "longer"

---

---

---

---

---

---

---

5

The forearm: radioulnar articulation

**FOREARM SUPINATION**

- the bony thickening on the proximal aspect of the radial head rests between the capitulum & trochlea
- causes the radius to translate proximally

---

---

---

---

---

---

---

---

6

**The forearm: radioulnar articulation**

**FOREARM SUPINATION**

- at the distal radioulnar joint (DRUJ), the ulnar head will appear to “shortened”

**Interosseous membrane (IOM)**

- provides a unique function for stability at the DRUJ and the ulnar aspect of the wrist
- tough membrane not easily injured, but can be torn with a traumatic event

**FUNCTIONS:**

- almost no nociceptors
- load transfer system
- proprioceptive function: involved in coordination of the forearm
- mechanics: holds the radius & ulna together as a unit

**DRUJ: special test interpretation**

- If the patient's passive translation test is normal, the DRUJ mobility is normal....performing joint mobilization on the DRUJ may produce hypermobility in the future! ☹

47

---

---

---

**DRUJ: treatment**

- If the DRUJ is hypermobile in one direction and hypomobile in the other...may be a mal-alignment or subluxation of the DRUJ. If you re-position the ulnar head and forearm rotation improves, then consider manual pressure on the ulnar head or splinting to maintain proper alignment!

PRUJ: special tests

Radial Head Hypermobility Test

- Most common problem: the radial head rests or moves too far in a dorsal-lateral direction
- A malalignment at the PRUJ can contribute to limited forearm rotation
- Compared to unaffected side

**Supination: PRUJ biomechanics**

**Neutral**      **Supination**

**Proximal Radioulnar Joint (PRUJ)**

- Opposite arthrokinematics: The radial head rolls in a dorsal-lateral direction and glides volar-medial
- When facilitating supination, we want to follow the joint's normal arthrokinematics pattern by promoting the glide in a volar-medial direction
